

ShopPAK Mobile

Version 1.0.1

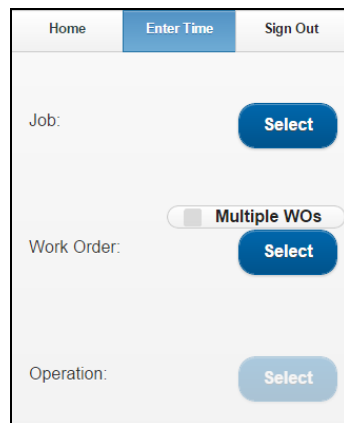

Release Notes

Enhancements

1. Updated the Mobile Controller so it automatically starts communication when it is launched. In the prior release, the user had to manually start communications. Note, you can still stop and start communication manually through the Mobile Controller's menu:

2. Mobile Controller settings for database name and internal port are now saved between sessions. This is useful when a customer has more than one TradeSoft database, and thus, are running multiple Controllers to process remote calls to and from different TradeSoft databases.
3. Changed the ShopPAK Mobile login page to mask passwords as they are typed in.
4. Added a checkbox during time entry so a user can decide whether they want to select multiple work orders or not. The multiple work order selection page takes longer to load so this helps speed communication between the smart, hand-held device and the TradeSoft database.

5. Added license verification for ShopPAK Mobile, so we can now provide temporary licenses to new ShopPAK Mobile customers.

Corrections

1. In the prior release, if a crew member had their own ShopPAK Mobile profile, we used the employee's profile when a supervisor filled in a time sheet entry for them. This had the potential outcome of not automatically creating Time and Attendance transactions, if the employee didn't have this option turned on in their profile. In this release, we always use the supervisor's profile settings when the supervisor enters time for other employees.
2. Fixed small inconsistencies on web pages when displaying work order description.
